EXPERIENCE

Software Engineer / builtby.win	Aug 2022 – Present
- Build and ship full-stack products, client sites, and developer tools independently, from product concept through production release. - Built back2vibing to coordinate 4–5 concurrent AI coding sessions, alerting when agents need input, permission, or review and opening the relevant tmux session. - Developed a floating macOS session dock for back2vibing that stays above other windows and supports hover previews without interrupting work. - Co-built the areyougo.ing MVP in under four days; it syncs ticket emails and marks attendance automatically so friends can discover shared live events. - Built Import Magic for automated media offloading and duplicate detection.	
Software Engineer / DoorDash	Aug 2019 – Aug 2022
- Led engineering for Japan and Germany launches, resolving localization, currency, and legacy-system edge cases. - Led a 15-person legal and engineering group to deliver GDPR compliance and unblock the Germany launch. - Delivered the identity support Stripe KYC required for Japanese Dasher payouts before launch. - Identified roughly 50k daily invalid order-to-item requests and coordinated backend validation across teams. - Rebuilt the item-modal UI, built the DoorDash landing page still in use, and delivered item re-ordering.	
Software Engineer / SigFig	Apr 2018 – Aug 2019
Software Engineer / FinancialForce	Apr 2017 – Apr 2018

SUMMARY

Software engineer with about 10 years of experience building full-stack, 0→1 products and launch-critical systems.

SELECTED PRODUCTS

back2vibing	Agent-session dashboard
areyougo.ing	Event-attendance discovery
Zero Stack	Sites and apps for small businesses
Import Magic	Media offloading and duplicate detection

EDUCATION

University of California, Los Angeles
Chemical Engineering
